

Parking lot USB Analysis

Contents	<i>The USB drive contains a mix of personal files and work documents belonging to HR Manager Jorge Bailey. These include personal items like family and pet photos, along with sensitive hospital files such as new hire letters and employee shift schedules. Together, these files contain personally identifiable information (PII) alongside confidential operational details.</i>
Attacker mindset	<i>An attacker could use the shift schedule and new hire details to draft convincing spear-phishing emails to hospital staff. They could also leverage personal information to impersonate Jorge, crack his passwords, or gain initial access to the network. Even if staged, the drive could act as a distraction while hidden malware quietly establishes a backdoor.</i>
Risk analysis	<i>Organizations can block USB baiting through technical controls like using Group Policy to disable USB ports or blocking unauthorized storage devices. Operationally, regular security awareness training teaches staff never to plug in unknown drives and to report them straight to IT. Managerially, enforcing clear device-use policies and requiring strong encryption on company-issued drives helps keep sensitive data safe if a device is ever lost.</i>
